Accurate, reliable, and fast WDM wavelength testing.

The 438 Series Multi-Wavelength Meter from Bristol Instruments combines proven Michelson interferometer-based technology with fast Fourier transform analysis in order to measure the wavelength, power, and OSNR of as many as 1000 discrete optical signals. With features such as high accuracy, 10 Hz measurement rate, and a broad operational range of 1000 to 1680 nm, the model 438 provides the most precise, efficient, and versatile wavelength testing of laser transceivers and WDM signals.

Two versions of the 438 Multi-Wavelength Meter are available. The model 438A is the most precise, providing an accuracy of ± 0.3 pm. For less exacting test requirements, the model 438B is a lower-priced alternative with a wavelength accuracy of ± 1.0 pm. Continuous calibration with a built-in wavelength standard ensures the utmost confidence in the test results.

The rugged design of the 438 Multi-Wavelength Meter provides long-term reliable operation, backed by a five-year warranty on all parts and labor. This results in less downtime and the lowest cost of ownership available.
